
Is Software Testing Dead due to Artificial Intelligence (AI)? Absolutely not

Software testing job is Secure Green Field, it never succumb to Artificial Intelligence. It is important to know that technology does not always displace humans. In fact, it often creates more opportunities than it destroys. The MP3 threatened the music industry and then along came iTunes, iPhone and Digital that created unprecedented job opportunities for entrepreneurs, programmers/testers, and musicians all over the globe.

It is apparent, more than 80% of testing is repetitive and this work is solvable by AI (Artificial Intelligence) with automation. That other 20% of a tester's time today, the creative, questioning, reasoning part-that is what people should really be doing, and that rarely happens in today's fast moving and Agile App teams.

However, I remain confident that software testing (as a human-based industry) will continue to flourish for many years to come. But growing complexity often requires greater control-especially human control. And the increasing sophistication of today's applications created extraordinary, unknowable opportunities that must be rigorously developed and testing on an ongoing basis.
